on

Health Monitoring Management System

ACKNOWLEDGEMENT

"I have taken efforts in this project. However, it would not have been possible without the kind support and help of many individuals and organizations. I would like to extend my sincere thanks to all of them.

I am highly indebted to (Name of your Organization Guide) for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project.

I would like to express my gratitude towards my parents & member of (Organization Name) for their kind co-operation and encouragement which help me in completion of this project.

I would like to express my special gratitude and thanks to college persons for giving me such attention and time.

My thanks and appreciations also go to my colleague in developing the project and people who have willingly helped me out with their abilities."

Project Associates:

1. INTRODUCTION

1.1. Scope of The Project

The objective of this application is to develop a system that effectively manages all the data related to the health monitoring like blood sugar monitoring, BP monitoring and temperature monitoring. The purpose is to maintain a centralized database of all health monitoring related information. The goal is to support various functions and processes necessary to manage the data efficiently.

1.2. Existing System

This existing system is not providing secure registration and profile management of all the users properly. This system is not providing on-line Help. This system doesn't provide tracking of users activities and their progress. This manual system gives us very less security for saving data and some data may be lost due to mismanagement. This system is not providing health management through internet. This system is not providing proper health information.

1.3. Proposed System

The development of this new system contains the following activities, which try to automate the entire process keeping in the view of database integration approach. This system maintains user's personal, and contact details. This system will provide on line help and search capabilities. User friendliness is provided in the application with various controls provided by system rich user

interface. Authentication is provided for this application only registered users can access. Health monitoring information files can be stored in centralized database which can be maintained by the system. This system provides the users to manage the health monitoring data systematically. This system basically lessens the manual work and improves the quality of maintaining records and other information related to health monitoring. One of the solutions that we are going to discuss here to speed up the database response by using MySQL Server database and to reduce the time complexity by using multi-user environment. Multi-user environment reduces burden with effortless maintenance.

2. SYSTEM ANALYSIS

2.1 FEASIBILITY STUDY

A feasibility study is a high-level capsule version of the entire System analysis and Design Process. The study begins by classifying the problem definition. Feasibility is to determine if it's worth doing. Once an acceptance problem definition has been generated, the analyst develops a logical model of the system. A search for alternatives is analyzed carefully. There are 3 parts in feasibility study.

2.1.1 Operational Feasibility

Question that going to be asked are Will the system be used if it developed and implemented.

If there was sufficient support for the project from the management and from the users.

Have the users been involved in planning and development of the Project.

2.1.2 Technical feasibility

Does the necessary technology exist to do what is been suggested Does the proposed equipment have the technical capacity for using the new system? Are there technical guarantees of accuracy, reliability and data security? The project is developed on Pentium III with 128 MB RAM. The environment required in the development of system is any windows platform.

The observer pattern along with factory pattern will update the results eventually.

The language used in the development is PHP, Apache Server and database as MySQL.

2.1.2 Economical Feasibility

To decide whether a project is economically feasible, to consider various factors as cost benefit analysis, long-term returns and maintenance costs.

2.2 FUNCTIONAL REQUIREMENTS

Functional requirement defines a function of a software system or its component. A function is described as a set of inputs, the behaviour, and outputs. Functional requirements may be calculations, technical details, data manipulation and processing and other specific functionality that define what a system is supposed to accomplish. Behavioural requirements describing all the cases where the system uses the functional requirements are captured in use cases.

NUMBER OF MODULES

The system after careful analysis has been identified to be presented with the following modules:

Health Monitoring Management System Module

In HMMS project we use PHP and MySQL database. It has two modules.

- 1.Admin Module
- 2.User Module

Admin Module

1. **Dashboard:** In this section, admin can see all detail in brief like the total registered users, Total member, Total Blood Pressure Entry and Total Blood Sugar entry.
2. **Manage Test Range:** In this section, admin can update the test range.
3. **View Reg Users:** In this section, admin view the detail of registered users.
4. **BP Report:** In this section, admin can view the detail of blood pressure report of particular member of registered user.

5. **Blood Sugar Report:** In this section, admin can view the detail of blood sugar report of particular member of registered user.
6. **Temperature Report:** In this section, admin can view the detail of body temperature report of particular member of registered user.

Admin can also update his profile, change password and recover password.

User Module

1. **Dashboard:** This is welcome page of user in which he/she view the detail of test range.
2. **Members:** In this section, user can manage his/her family member(add/del/update).
3. **BP Monitoring:** In this section, user can add blood pressure of his/her family member and view the monitoring history of blood pressure.
4. **Sugar Monitoring:** In this section, user can add blood sugar of his/her family member and view the monitoring history of blood sugar.
5. **Temperature Monitoring:** In this section, user can add body temperature of his/her family member and view the monitoring history of body temperature.
6. **BP Report:** In this section, user can view the detail of blood pressure report of particular member according to date.
7. **Blood Sugar Report:** In this section, user can view the detail of blood sugar report of particular member according to date.
8. **Temperature Report:** In this section, admin can view the detail of body temperature report of particular member according to date.

User can also update his profile, change password and recover password.

2.3 NON-FUNCTIONAL REQUIREMENTS

Performance Requirements:

Performance is measured in terms of the output provided by the application. Requirement specification plays an important part in the analysis of a system. Only when the requirement specifications are properly given, it is possible to design a system, which will fit into required environment. It rests largely with the users of the existing system to give the requirement specifications because they are the people who finally use the system. This is because the requirements have to be known during the initial stages so that the system can be designed according to those requirements. It is very difficult to change the system once it has been designed and on the other hand designing a system, which does not cater to the requirements of the user, is of no use.

The requirement specification for any system can be broadly stated as given below:

The system should be able to interface with the existing system
The system should be accurate.

The system should be better than the existing system

Reliability:

In this system reliability means the mail which is send by the source must reach the target user with any modification and accurate.

Security:

The web server and database server should be protected from hacking, virus etc

Portability:

The application will be developed using standard open source software like PHP, Apcahe web server, MySQL database, Internet Explorer Browser etc these software will work both on Windows and Linux o/s. Hence portability problems will not arise.

Availability:

This software will be available always.

Maintainability:

In this system the presentation layer is clearly separated from the service layer. So any modification in future will be done with less efforts. The database will be running at the server. Users access these forms by using the user-ids and the passwords.

2.4 HARDWARE REQUIREMENTS:

Processor	: Intel P-IV based system
Processor Speed	: 2.0. GHz
RAM	: 1GB
Hard Disk	: 40GB to 80GB

2.5 SOFTWARE REQUIREMENTS:

Database	: MySQL
Server	: Apache
Frontend Scripting language	: HTML Java Script
IDE	: Sublime
Technology	: PHP

3. SYSTEM DESIGN

3.1 Class Diagram:

The class diagram shows a set of classes, interfaces, collaborations and their relationships.

Fig: 3.1.1.1 Class diagram for on health monitoring management

3.1.1 Use case diagrams:

Use case diagram consists of actors, use cases and their relationships. These diagrams are especially important in organizing and modelling the behaviours of a system.

Fig: 3.1.2.1 Use case diagram for user

Admin

Fig: 3.1.2.2 Use case diagram for Administration

3.2 ER-DIAGRAM

Fig: 3.1.3 ER diagram for Health Monitoring System

3.3 Data Flow Diagram

Data Flow Diagrams

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It can be manual, automated, or a combination of both.

It shows how data enters and leaves the system, what changes the information, and where data is stored.

The objective of a DFD is to show the scope and boundaries of a system as a whole. It may be used as a communication tool between a system analyst and any person who plays a part in the order that acts as a starting point for redesigning a system. The DFD is also called as a data flow graph or bubble chart.

The following observations about DFDs are essential:

1. All names should be unique. This makes it easier to refer to elements in the DFD.
2. Remember that DFD is not a flow chart. Arrows in a flow chart that represents the order of events; arrows in DFD represents flowing data. A DFD does not involve any order of events.
3. Suppress logical decisions. If we ever have the urge to draw a diamond-shaped box in a DFD, suppress that urge! A diamond-shaped box is used in flow charts to represent decision points with multiple exists paths of which the only one is taken. This implies an ordering of events, which makes no sense in a DFD.
4. Do not become bogged down with details. Defer error conditions and error handling until the end of the analysis.

Standard symbols for DFDs are derived from the electric circuit diagram analysis and are shown in fig:

Symbol	Name	Function
	Data flow	Used to Connect Processes to each , other , to sources or Sinks; te arrow head indicates direction of data flow.
	Process	Performs Some transformation of Input data to yield output data.
	Source of Sink (External Entity)	A Source of System inputs or Sink of System outputs.
	Data Store	A repository of data; the arrow heads indicate net inputs and net outputs to store.

Symbols for Data Flow Diagrams

Circle: A circle (bubble) shows a process that transforms data inputs into data outputs.

Data Flow: A curved line shows the flow of data into or out of a process or data store.

Data Store: A set of parallel lines shows a place for the collection of data items. A data store indicates that the data is stored which can be used at a later stage or by the other processes in a different order. The data store can have an element or group of elements.

Source or Sink: Source or Sink is an external entity and acts as a source of system inputs or sink of system outputs.

Zero Level

First Level

Second Level

3.4 Tables

The data in the system has to be stored and retrieved from database. Designing the database is part of system design. Data elements and data structures to be stored have been identified at analysis stage. They are structured and put together to design the data storage and retrieval system.

A database is a collection of interrelated data stored with minimum redundancy to serve many users quickly and efficiently. The general objective is to make database access easy, quick, inexpensive and flexible for the user. Relationships are established between the data items and unnecessary data items are removed. Normalization is done to get an internal consistency of data and to have minimum redundancy and maximum stability. This ensures minimizing data storage required, minimizing chances of data inconsistencies and optimizing for updates. The MySQL database has been chosen for developing the relevant databases.

Health Monitoring Management System (HMMS) contains 7

MySQL tables:

tbladmin : This table store the admin login details

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	AdminName	varchar(120)	utf8mb4_general_ci		Yes	NULL		
3	UserName	varchar(120)	utf8mb4_general_ci		Yes	NULL		
4	MobileNumber	bigint(10)			Yes	NULL		
5	Email	varchar(200)	utf8mb4_general_ci		Yes	NULL		
6	Password	varchar(120)	utf8mb4_general_ci		Yes	NULL		
7	AdminRegdate	timestamp			Yes	current_timestamp()		

tblbp: This table store the blood pressure monitoring details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	MemberID 	int(5)			Yes	NULL		
3	SYS	int(5)			Yes	NULL		
4	DIA	int(10)			Yes	NULL		
5	Pulses	int(10)			Yes	NULL		
6	EnterDate	timestamp			Yes	current_timestamp()		

tblmember: This table store the member details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	UserID 	int(5)			No	None		
3	FullName	varchar(200)	utf8mb4_general_ci		Yes	NULL		
4	Gender	varchar(50)	utf8mb4_general_ci		Yes	NULL		
5	Age	int(5)			Yes	NULL		
6	Weight	varchar(50)	utf8mb4_general_ci		Yes	NULL		
7	Relation	varchar(45)	utf8mb4_general_ci		Yes	NULL		
8	CreationDate	timestamp			Yes	current_timestamp()		

tblrange: This table store the range details of test.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 🔑	int(10)			No	None		AUTO_INCREMENT
2	TestName	varchar(200)	utf8mb4_general_ci		Yes	NULL		
3	Description	mediumtext	utf8mb4_general_ci		Yes			
4	CreationDate	timestamp			Yes	current_timestamp()		

tblsugar: This table store the blood sugar monitoring details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 🔑	int(10)			No	None		AUTO_INCREMENT
2	MemberID 🔑	int(5)			Yes	NULL		
3	Typeoftest	varchar(50)	utf8mb4_general_ci		Yes	NULL		
4	BloodSugar	int(10)			Yes	NULL		
5	EnterDate	timestamp			Yes	current_timestamp()		

tbltemp: This table store the body temperature monitoring details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 🔑	int(10)			No	None		AUTO_INCREMENT
2	MemberID 🔑	int(5)			Yes	NULL		
3	BodyTemparture	int(50)			Yes	NULL		
4	EnterDate	timestamp			Yes	current_timestamp()		

tbluser: This table store the details of registered users.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	<i>None</i>		AUTO_INCREMENT
2	FullName	varchar(200)	utf8mb4_general_ci		Yes	<i>NULL</i>		
3	MobileNumber	bigint(10)			Yes	<i>NULL</i>		
4	Email	varchar(200)	utf8mb4_general_ci		Yes	<i>NULL</i>		
5	Password	varchar(200)	utf8mb4_general_ci		Yes	<i>NULL</i>		
6	RegDate	timestamp			Yes	<i>current_timestamp()</i>		

4. IMPLEMENTATION

INTRODUCTION:

Implementation is the stage of the project when the theoretical design is turned out into a working system. Thus, it can be considered to be the most critical stage in achieving a successful new system and in giving the user, confidence that the new system will work and be effective. The implementation stage involves careful planning, investigation of the existing system and its constraints on implementation, designing of methods to achieve changeover and evaluation of changeover methods.

4.1 TECHNOLOGIES USED

Programming Language

PHP

- ✓ PHP stands for PHP: Hypertext Preprocessor
- ✓ PHP is a server-side scripting language,
like ASP
- ✓ PHP scripts are executed on the server
- ✓ PHP supports many databases (MYSQL, Informix, Oracle,
Sybase, Solid, Generic ODBC, etc.)
- ✓ PHP is an open source
software

- ✓ PHP is free to download and use

MYSQL

- ✓ MYSQL is a database server
- ✓ MYSQL is ideal for both small and large applications
- ✓ MYSQL supports standard SQL
- ✓ MYSQL compiles on a number of platforms
- ✓ MYSQL is free to download and use

CSS

- ✓ Cascading Style Sheets (CSS)
- ✓ Simple mechanism
- ✓ Easy for adding style (e.g., fonts, colors, spacing) to Web documents.

5. TESTING

Introduction

The purpose of testing is to discover errors. Testing is the process of trying to discover every conceivable fault or weakness in a work product. It provides a way to check the functionalities of components, sub assemblies, and/or a finished product it is the process of exercising software with the intent of ensuring that the software system meets its requirements and user expectations and does not fail in an unacceptable manner. There are various types of tests. Each test type addresses a specific testing requirement.

5.1 Types of Testing

5.1.1 Unit Testing

Unit testing focuses verification effort on the smallest unit of software design, the module. The unit testing, we have is white box oriented and some modules the steps are conducted in parallel.

5.1.2. Integration Testing

Testing is done for each module. After testing all the modules, the modules are integrated and testing of the final system is done with the test data, specially designed to show that the system will operate successfully in all its aspects conditions. Thus the system testing is a confirmation that all is correct and

an opportunity to show the user that the system works. The purpose of integration testing is to verify functional, performance and reliability requirements placed on major design items. These "design items", i.e. assemblages (or groups of units), are exercised through their interfaces using black box testing, success and error cases being simulated via appropriate parameter and data inputs. Simulated usage of shared data areas and inter-process communication is tested and individual subsystems are exercised through their input interface.

Test cases are constructed to test that all components within assemblages interact correctly, for example across procedure calls or process activations, and this is done after testing individual modules, i.e. unit testing.

5.1.5 System Testing

System testing ensures that the entire integrated software system meets requirements. It tests a configuration to ensure known and predictable results. An example of system testing is the configuration oriented system integration test. System testing is based on process descriptions and flows, emphasizing pre-driven process links and integration points.

White Box Testing

This type of testing ensures that

All independent paths have been exercised at least once

All logical decisions have been exercised on their true and false sides

All loops are executed at their boundaries and within their

operational bounds All internal data structures have been

exercised to assure their validity.

To follow the concept of white box testing we have tested each form .we have created independently to verify that Data flow is correct, All conditions are exercised to check their validity, All loops are executed on their boundaries.

Basic Path Testing

Established technique of flow graph with Cyclometer complexity was used to derive test cases for all the functions. The main steps in deriving test cases were:

Use the design of the code and draw correspondent flow graph.

Conditional Testing

In this part of the testing each of the conditions were tested to both true and false aspects. And all the resulting paths were tested. So that each path that may be generate on particular condition is traced to uncover any possible errors.

Data Flow Testing

This type of testing selects the path of the program according to the location of definition and use of variables. This kind of testing was used only when some local variable were declared. The definition-use chain method was used in this type of testing. These were particularly useful in nested statements.

Loop Testing

In this type of testing all the loops are tested to all the limits possible. The following exercise was adopted for all loops: All the loops were tested at their limits, just above them and just below them. All the loops were skipped at least once. For nested loops test the inner most loop first and then work outwards. For concatenated loops the values of dependent loops were set with the help of connected loop. Unstructured loops were resolved into nested loops or concatenated loops

and tested as above. Each unit has been separately tested by the development team itself and all the input have been validated.

7. CONCLUSION

The “**Health Monitoring Management System**” was successfully designed and is tested for accuracy and quality. During this project we have accomplished all the objectives and this project meets the needs of the organization. One of the solutions that we are going to discuss here to speed up the database response by using SQL Server database and to reduce the time complexity by using multi-user environment. Multi-user environment reduces burden with effortless maintenance.

GOALS ACHIVIED

- ✓ Reduced entry work.
- ✓ Easy retrieval of information.
- ✓ Reduced errors due to human intervention.
- ✓ User friendly screens to enter the data.
- ✓ Portable and flexible for further enhancement.
- ✓ Web enabled.
- ✓ Fast finding of information request.
